**Keywords:** AD Model Builder (ADMB), random effects, state-space models, spatial statistics.

### **Abstract:**

ADMB is a software package that provides a flexible mixed-model framework, and which is well suited for building R packages. `gmmADMB` is an example of an R package which does its core computation in ADMB. The term "mixed model" should be interpreted broadly and includes state-space models and models in spatial statistics. This poster gives examples of the use of ADMB and provides a meeting point for people who want to talk to ADMB developers.
